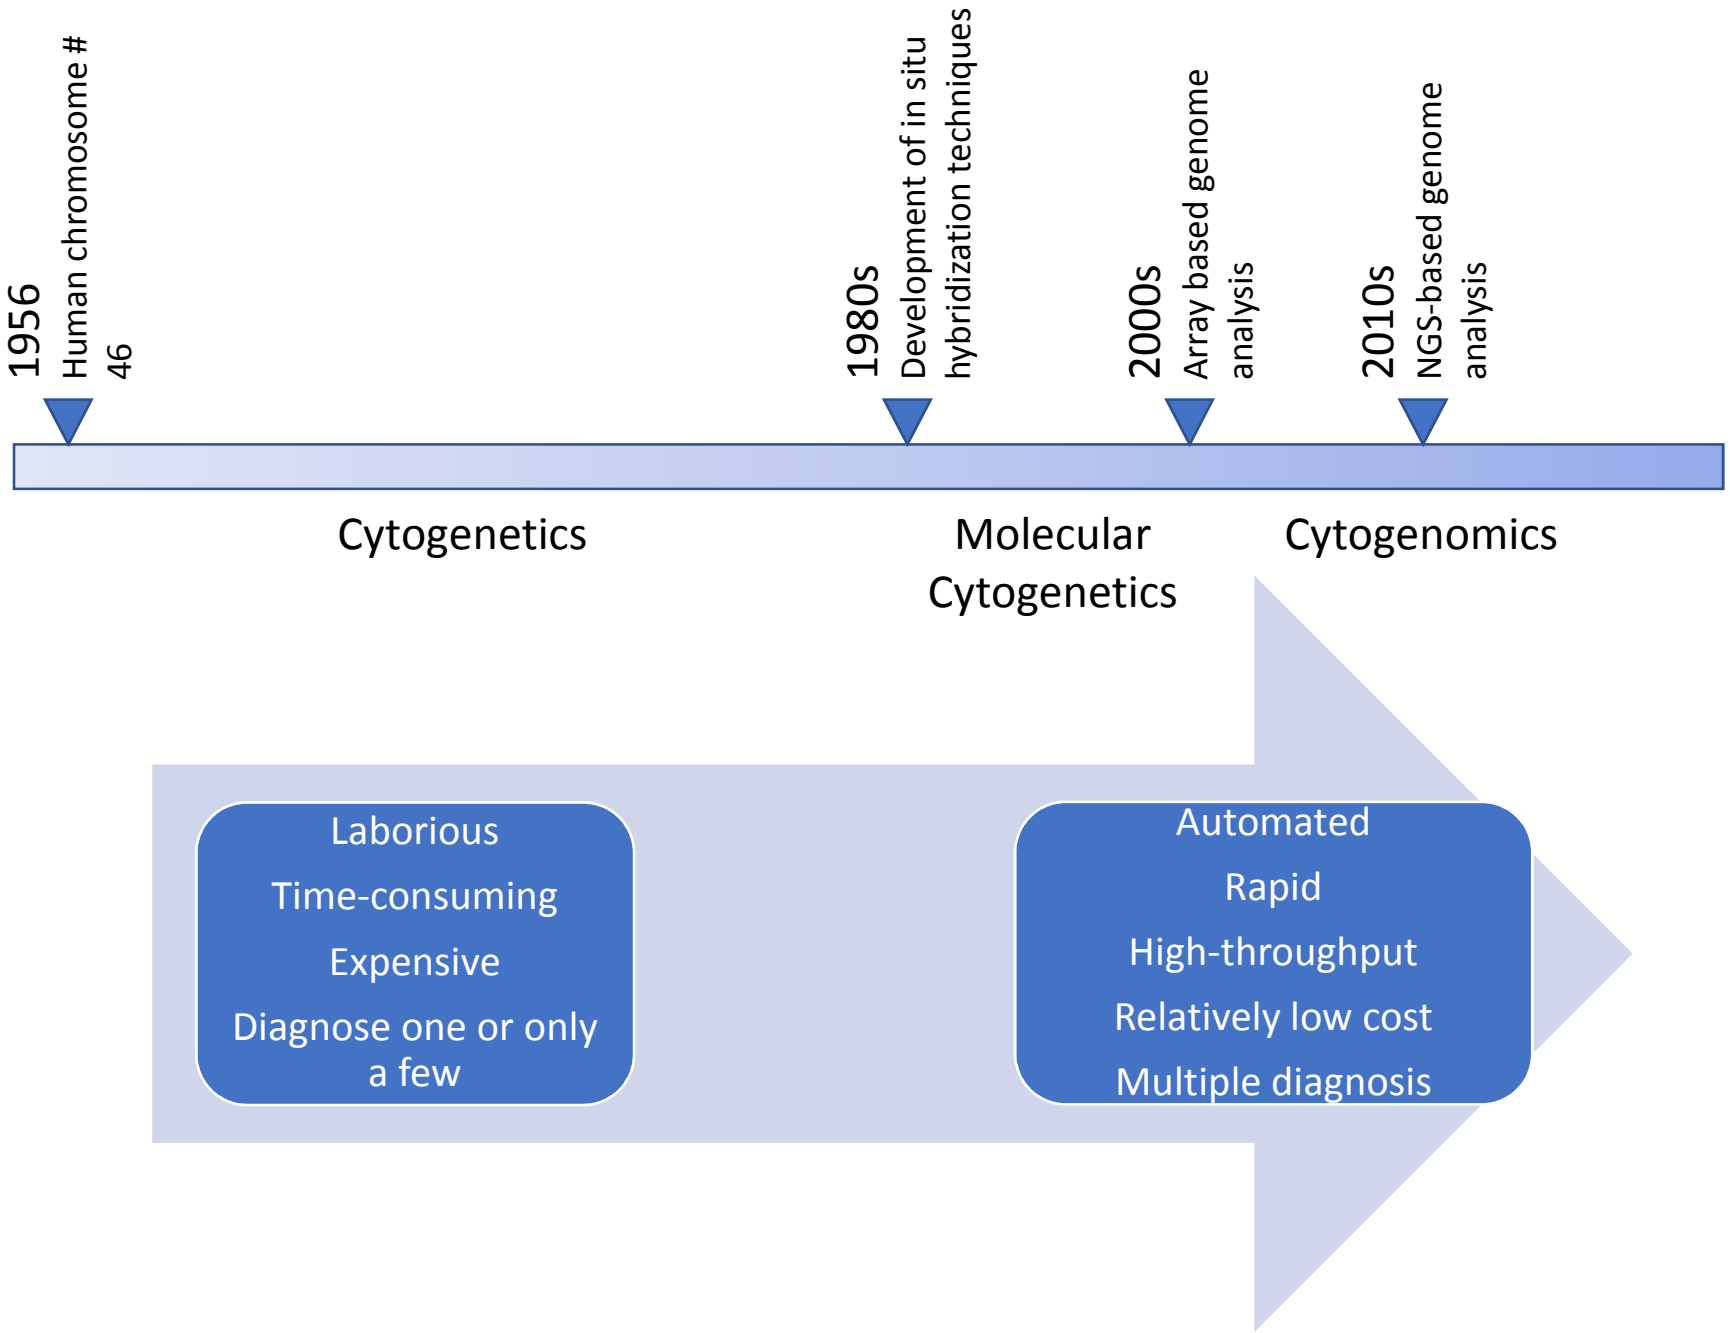
Genetic Research

Genome analysis

- Prenatal/preimplantation
- Congenital anomalies

- SNP-array
- Exome sequencing
- Low-depth whole genome sequencing



1956
Human chromosome # 46
1980s
Development of in situ hybridization techniques
2000s
Array based genome analysis
2010s
NGS-based genome analysis
Cytogenetics
Molecular Cytogenetics
Cytogenomics
Laborious
Time-consuming
Expensive
Diagnose one or only a few
Automated
Rapid
High-throughput
Relatively low cost
Multiple diagnosis

A comparison of clinically available methods to analyze the genome

	cytogenetics		DNA-based		
	G-banding karyotype	FISH	aCGH	SNP array	Whole exome sequencing
					Resolution	~10Mb (>5Mb)	Variable (kb ~ Mb)	< 1Mb	Several kb ~1Mb	Single base-pair
Cost	high	high	high	high	high
Sensitivity (true positive rate)	~5%	~5%	>20%	>20%	>20%

A comparison of clinically available methods to analyze the genome

	Cytogenetics		DNA-based		
	G-banding karyotype	FISH	aCGH	SNP array	Whole exome sequencing
					Unique strength	• Easy and reliable • High sensitivity for mosaic cultures • Detection of balanced chromosomal abnormalities	• High sensitivity for mosaic cultures • **Detection of complex karyotype and markers**	• High resolution • **CNV**	• High resolution • **LOH** • **UPD**	• Ultimate resolution • Point mutations
Unique limitations	• Low resolution	• Inability to identify CNVs	• Low sensitivity for mosaic cultures • Cannot detect polyploidy and balanced abnormalities	• Low sensitivity for mosaic cultures	• Difficulty interpretation (VUS)

	PCR-based	
	QF-PCR (1993~) 	MLPA Unique strength	• **Rapid method (within 24 hours) for prenatal aneuploid screening** • Required only small amount of sample – no cell culture • Relative low-cost • High-throughput	• A rapid, high throughput technique for copy number quantification – up to **50 different genomic DNA or RNA sequences** • Many different applications (probe mixes) - tumor profiling, **methylation profiling**
Unique limitations	• Low coverage (only 13, 18, 21, X and Y) • Homozygosity • False result due to MCC, low-rate mosaicism, STR duplication	• Can **not detect balanced** chromosomal abnormalities • A sufficient number of cells is required • Not genome-wide scanning

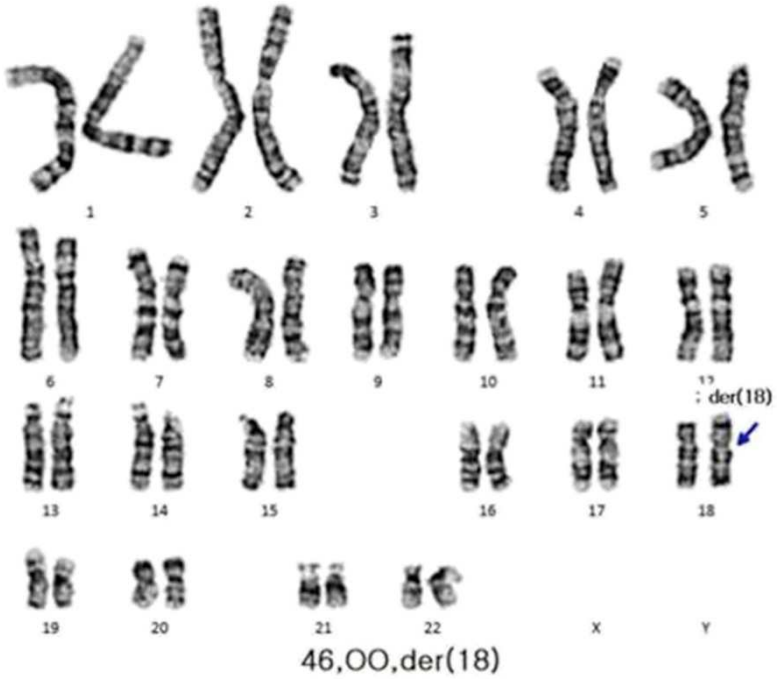
Cases

Case Report Taiwanese Journal of Obstetrics & Gynecology 58 (2019) 318e323

Prenatal diagnosis and molecular cytogenetic characterization of partial dup(18q)/del(18p) due to a paternal pericentric inversion 18 in a fetus with multiple anomalies

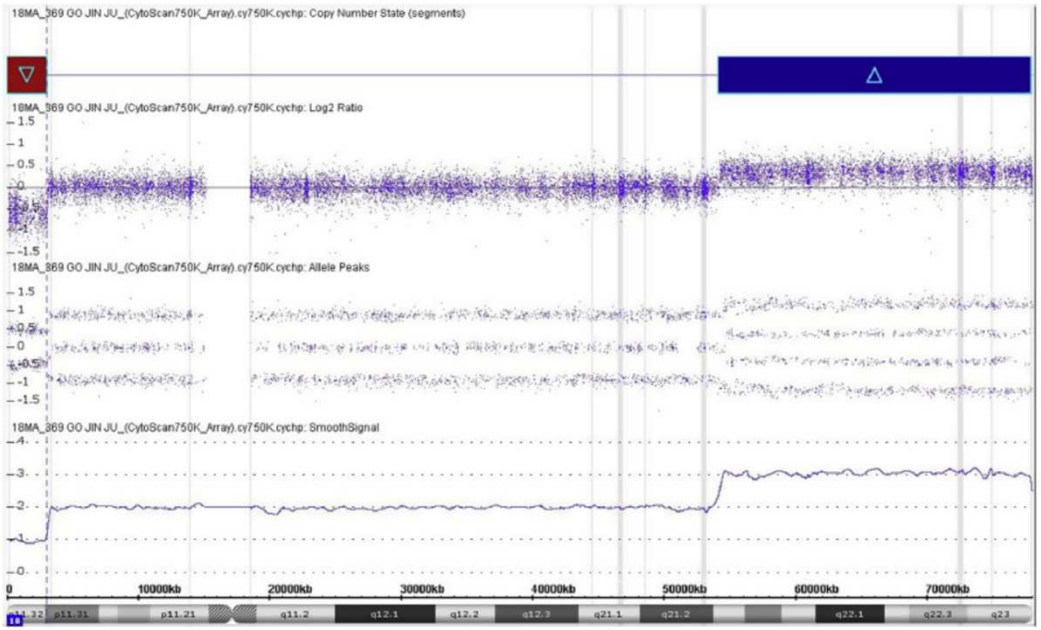
Min Jin Lee [a], Sang Hee Park [b], Sung Han Shim [b], Myoung-jin Moon [c,**], Dong Hyun Cha [a,*]

37-year-old F (Gravida 2, para 0, SA 1)
17 weeks and 5 days of gestation
Normal for integrated maternal serum screening
Abnormal ultrasound findings
Amniocentesis and chromosome analysis
→ 46,OO,der(18)

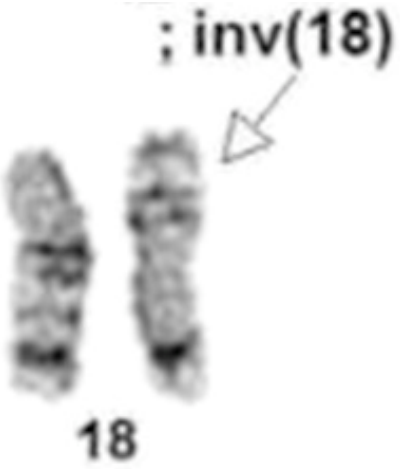


- Hypertelorism
- Clenched hands

Terminated at 23 weeks and 3 days of gestation



CytoScan 750K SNP array – 3Mb deletion of 18p/23.7Mb duplication of 18q



Father – balanced pericentric inversion carrier; inv(18)(p11.2q21.2)

- Patients: 24 clinically diagnosed as Stargardt disease
- Targeted exome sequencing design:
  - 39 genes including *ABCA4, ELOVL4, PROM1*
  - Ion Ampliseq™ target selection technology (Thermo Fisher, USA)
  - Target size : 112.72 kb, Amplicon : 958 ea
  - Coverage:

ABCA4	99.7%
ELOVL4	100%
PROM1	100%

Table 2. List of mutations identified from exome sequencing of the *ABCA4* gene

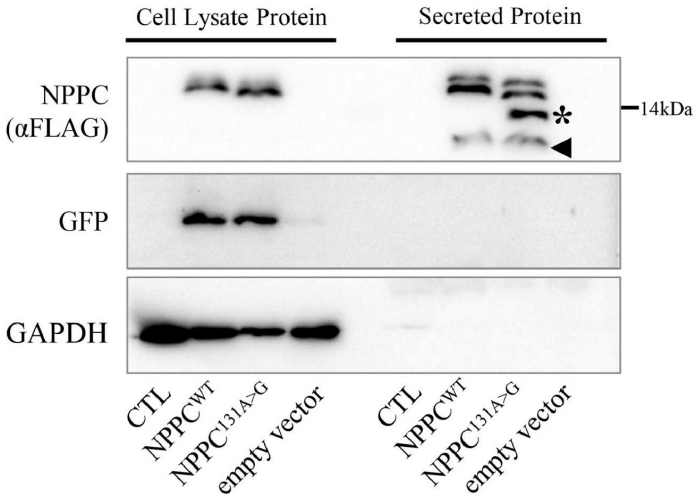
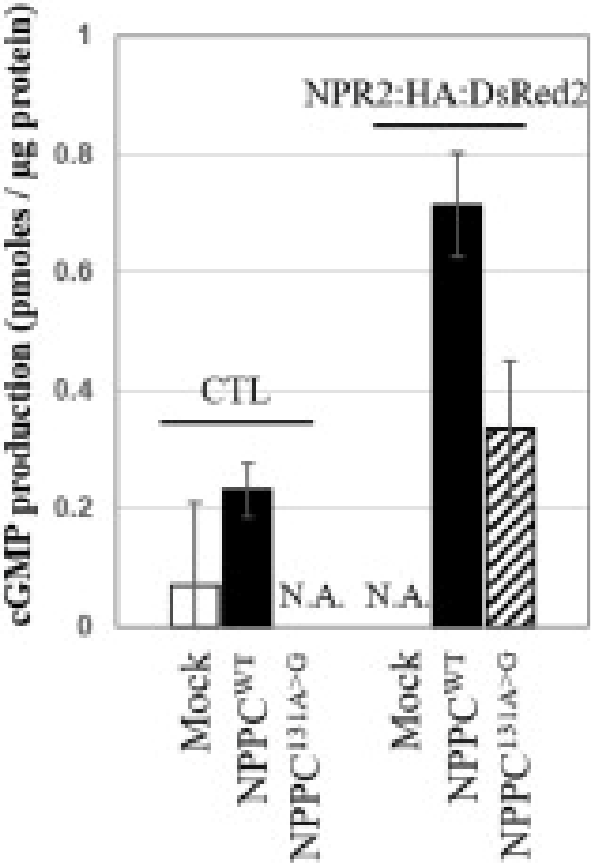
- *NPPC*
  - C-type natriuretic peptide (CNP)-encoding gene
  - Involved in follicle growth at the preantral stage
  - Prevents precocious resumption of oocyte meiosis





The mutation of *NPPC* leads to abnormal peptide cleavage, resulting in a decrease in cGMP levels and meiotic resumption, it could induce an exhaustion of follicular reserve or failure of follicular development.

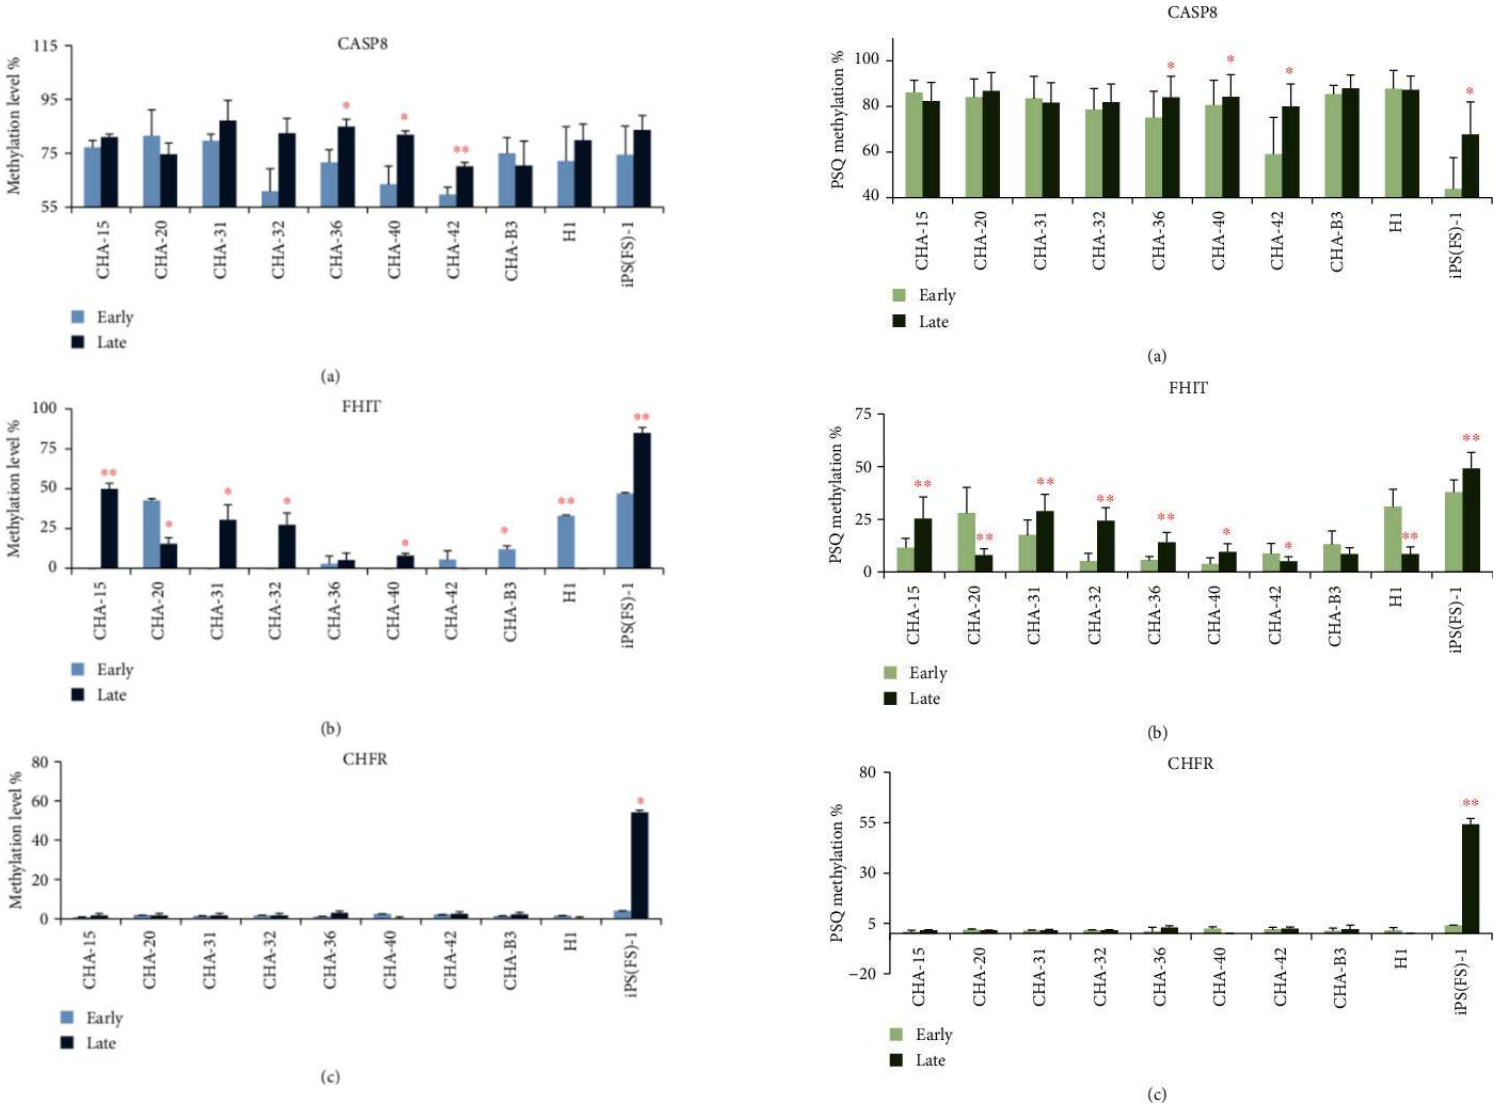
Changes in Methylation Patterns of Tumor Suppressor Genes during Extended Human Embryonic Stem Cell Cultures

Kyung Min Kang,[1] Jeoung Eun Lee,[2] Ji Eun Park,[1] Hyunjin Kim,[1] Hee Yeon Jang,[1] Minyeon Go,[1,3] Dong Ryul Lee,[3] and Sung Han Shim[3]

[1]*Center for Genome Diagnostics, CHA Biotech Inc., Seoul 06135, Republic of Korea*
[2]*CHA Advanced Research Institute, CHA University, Seongnam, Gyunggi-do 13488, Republic of Korea*
[3]*Department of Biomedical Science, College of Life Science, CHA University, Seongnam 13488, Republic of Korea*

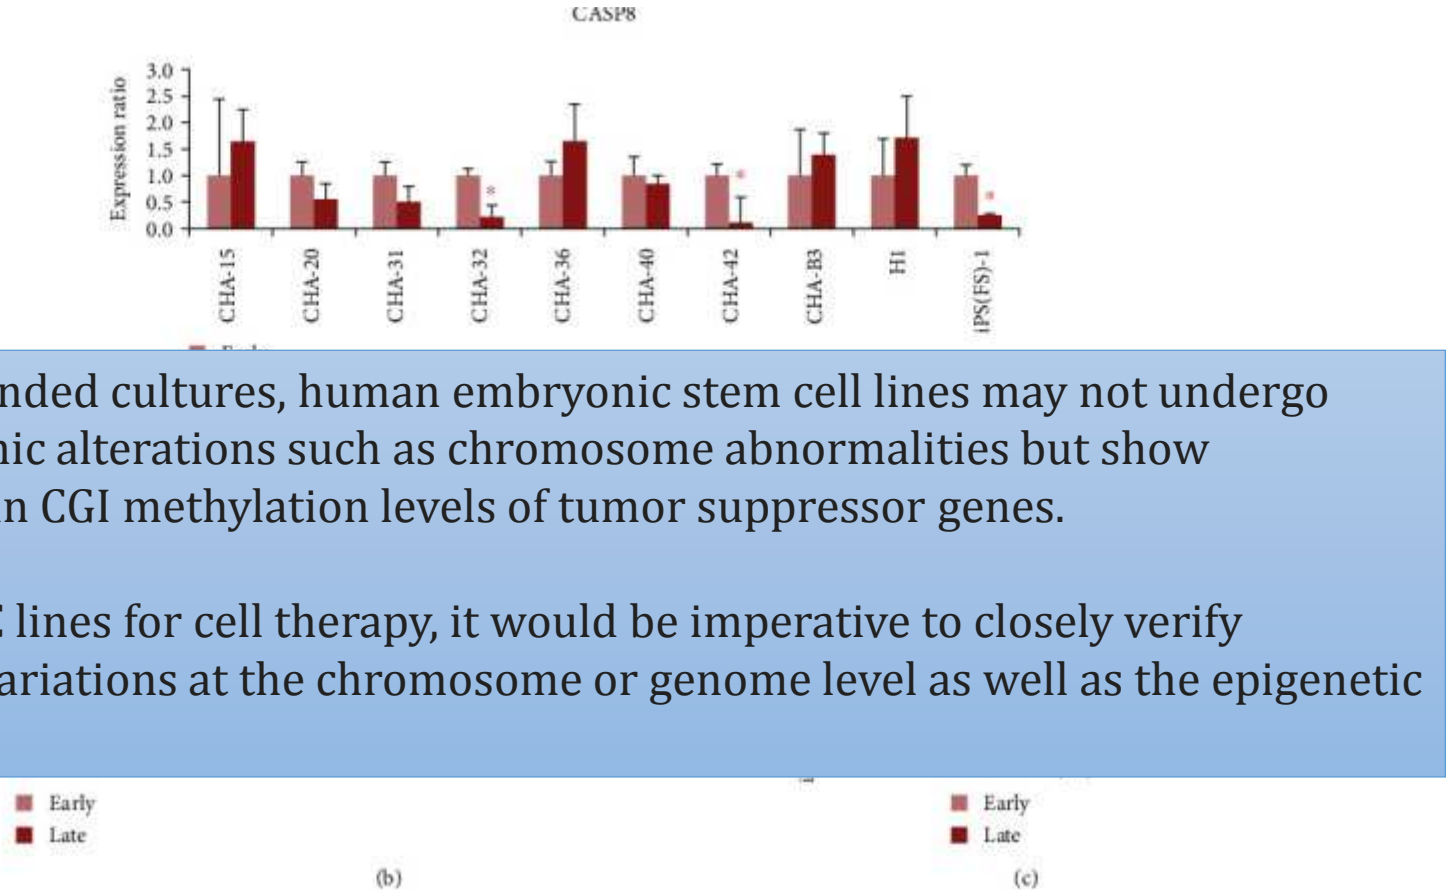
- 10 hESc lines
- CpG island methylation levels of 24 tumor suppressor genes were analyzed
- Methylation specific MLPA, pyrosequencing, real-time PCR



MS-MLPA

Pyrosequencing

Methylation level of the three genes (*CASP8, FHIT, CHFR*) between early passage and late passage of 10 cell lines using MS-MLPA and pyrosequencing.



- During extended cultures, human embryonic stem cell lines may not undergo large genomic alterations such as chromosome abnormalities but show alterations in CGI methylation levels of tumor suppressor genes.

- To use hESC lines for cell therapy, it would be imperative to closely verify structural variations at the chromosome or genome level as well as the epigenetic changes.

Expression level of the three genes between early passage and late passage of 10 cell lines using real-time PCR analysis. Expression ratio of the *CASP8* gene (a), *FHIT* gene (b), and *CHFR* gene in iPS (FS)-1 cell (c).

감사합니다.
