Efficacy of Allogeneic Cord Blood Cell Therapy Combined with Erythropoietin for Children with Cerebral Palsy

MinYoung Kim MD, Ph.D

Department of Rehabilitation Medicine
CHA Bundang Medical Center
CHA University College of Medicine

Contents

- Introduction of cerebral palsy
- Reports of 3 RCTs of cord blood cell +/- erythropoietin therapy
- Efficacy factors in cord blood cell therapy
- Animal and in vitro study for efficacy evaluation of cord blood + erythropoietin combination therapy in stroke model
- IL-8 as an efficacy inducing molecule in cord blood therapy

Cerebral palsy (CP)

- A group of neurodevelopmental conditions with abnormal movement and posture resulted from non-progressive disturbances that occurred in developing brain
- The most common cause of motor disability in childhood, life-long functional deficits
- Prevalence: 3 per 1000

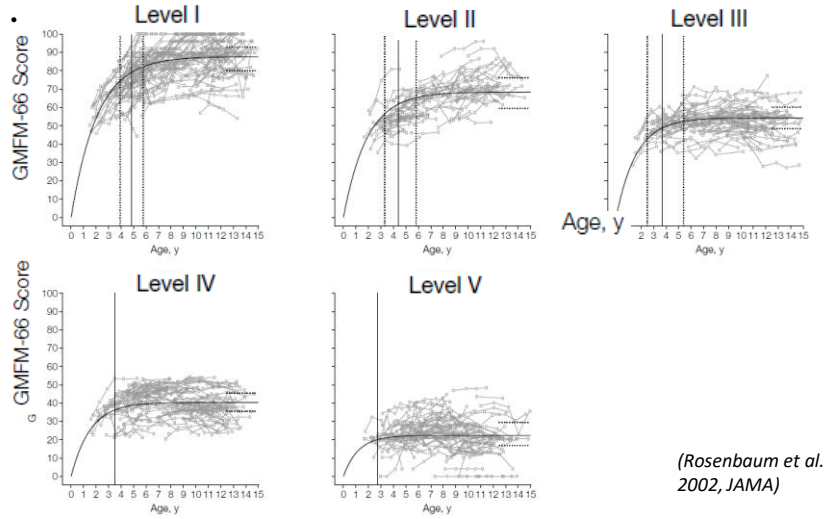
(Bax et al., 2005 Dev Med Child Neurol)

Regenerative medicine

- Most therapies: Palliative >> Restorative
- Cell therapy: Replacing or regenerating the affected neural tissues

(Harris et al. 2008, Stem Cell Dev)

Observed and predicted GMFM scores in each level of Gross Motor Function Classification System (GMFCS)



(Rosenbaum et al. 2002, JAMA)

Cause of reluctance to recovery

- Inflammatory milieu in the brain of CP

Periventricular leukomalacia (PVL)

Review

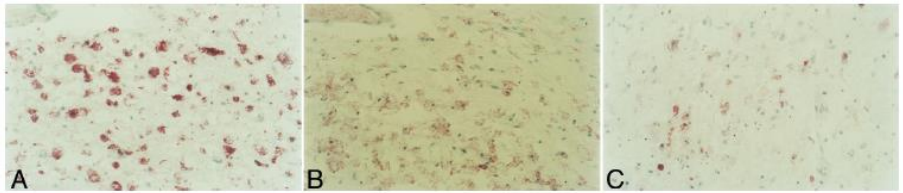
Dev Neurosci 2009;31:378–393
DOI: 10.1159/000232556

Received: December 3, 2008
Accepted after revision: March 3, 2009
Published online: August 11, 2009

Does Inflammation after Stroke Affect the Developing Brain Differently than Adult Brain?

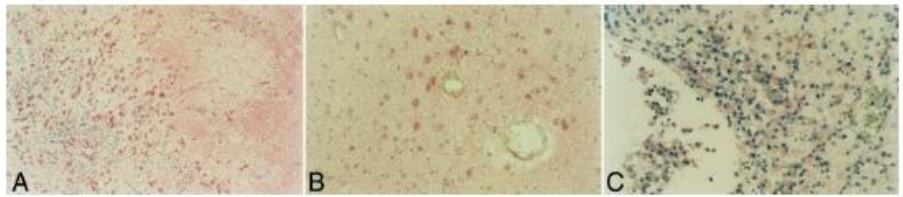
(Kadhim et al. 2001, Neurology)

Inflammatory cells in early PVL (3 to 5 days old)



A: CD68 B: Leukocyte common antigen C: Human leukocyte antigen II

in situ detection of cytokines in PVL

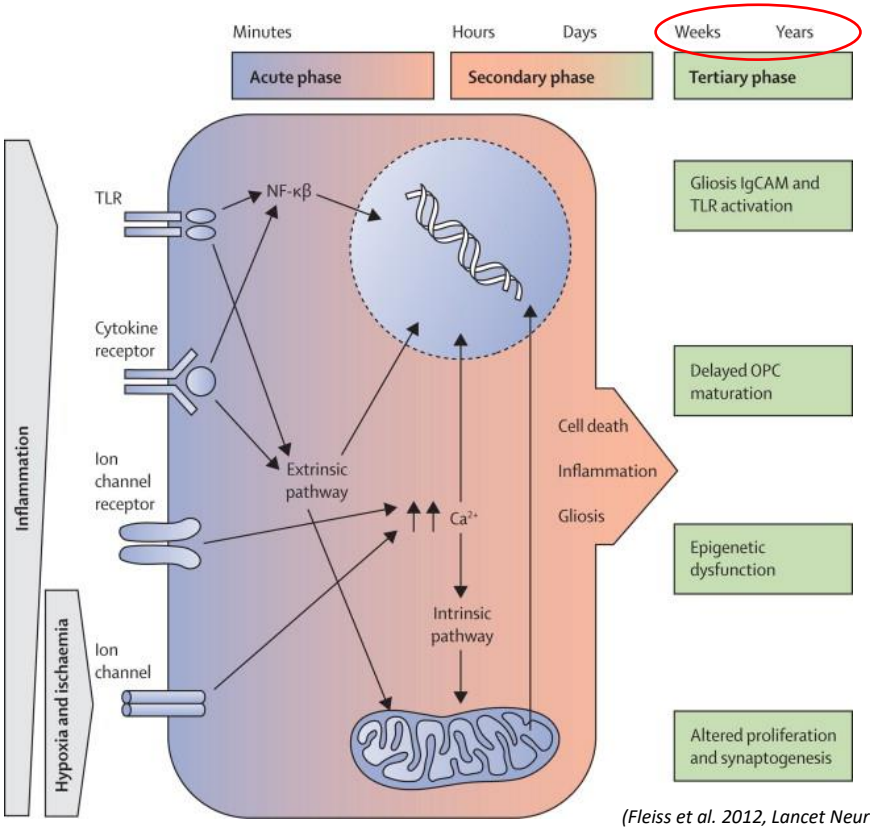


A: TNF α
Coagulative necrosis (early)

B: IL-6
Coagulative necrosis (early)

C: IL-1β
Cystic PVL (late)

Tertiary mechanisms of brain damage



(Fleiss et al. 2012, Lancet Neurol)

Tertiary brain damage

- Worsen outcome
- Predispose a patient to further injury
- Prevent repair or regeneration
  after an initial insult to the brain

Neuroprotection

Cell therapy

- Umbilical cord blood (UCB)
- Neural stem cell
- Mesenchymal stem cell

Pharmacological drugs

- Erythropoietin (EPO)
- Melatonin
- Growth factors

Duke University (USA; NCT00593242)

Advantages of UCB as a source of cell therapy

Umbilical Cord Blood

- Known as a stem cell source
  - Hematopoietic
  - Neurogenic
- Characteristics
  - Anti-inflammatory
  - Anti-apoptotic

Safety

- Used more over two decades
- Hematologic, immunologic, oncologic disorders, or inborn errors of metabolism

Gluckman, 1989; Kurtzberg, 2005; Carter 2006

Availability

- Off the shelf
- Cord blood banks

Harris, 2008

Lee, 2010

UCB

* suitable in regenerative medicine

Immune tolerance

- Immaturity

Tse, 2005; Vaziri, 1994; Lee, 2010

Differentiation

- Neuronal, astrocytic, oligo-dendroglial cell

Plan for clinical trials and immunosuppression

- Preliminary trial of (auto, allo) UCB infusion for small number of CP
- Rare preservation of autologous UCB in CP
- Plan to evaluate the efficacy of allogeneic UCB infusion for CP

Autologous UCB transplantation is the ideal approach in children with CP. However, most CP experience a difficult perinatal period that is unfavorable to harvest sufficient UCB.

Allogeneic UCB transplantation may thus represent a plausible alternative.

Immunosuppression is essential to prevent antibody generation and make up favorable environment for survival of allogeneic cells.

The 1st trial of UCB for children with CP

Title: Umbilical Cord Blood Therapy Potentiated with Erythropoietin for Children with Cerebral Palsy

Umbilical Cord Blood Therapy Potentiated with Erythropoietin for Children with Cerebral Palsy: A Double-blind, Randomized, Placebo-controlled Trial

Kyunghoon Min, MD,[a] Junyoung Song, MD[a], Jin Young Kang MD,[a] Jooyeon Ko PT, PhD,[a] Ju Seok Ryu Professor, MD, PhD,[a] Myung Seo Kang Professor, MD, PhD,[b] Su Jin Jang Professor, MD,[c] Sang Heum Kim Professor, MD,[d] Doyeun Oh Professor, MD, PhD,[e] Moon Kyu Kim Professor, MD, PhD,[f] Kim Sung Soo, Bio-statistician, PhD[g], MinYoung Kim, MD, PhD,[a]

(Min et al. 2013, Stem Cells)

Groups

Total 105 subjects
(Recruit: May 2010~ Nov 2010)

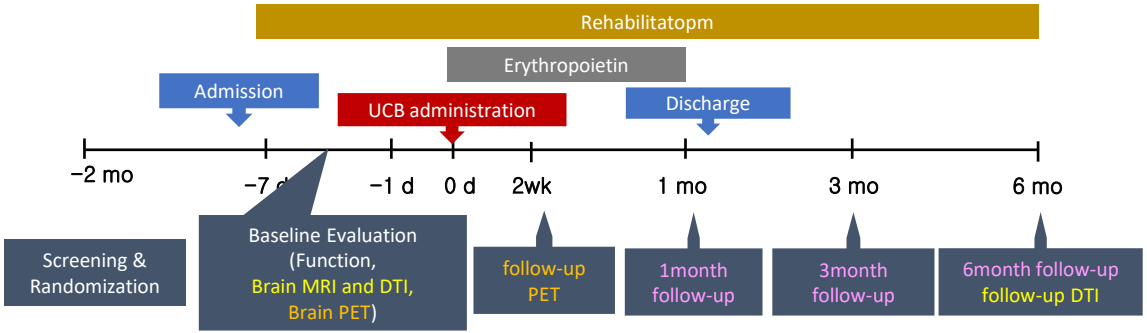
Randomized — Double-blind

pUCB (n=35)	EPO (n=36)	Control (n=34)
Allogeneic UCB + Erythropoietin + Rehabilitation	Placebo UCB + Erythropoietin + Rehabilitation	Placebo UCB + Placebo EPO + Rehabilitation

Intervention

- **IV administration**
- **Allogeneic UCB**
  - TNC>3×10^7/kg
  - HLA (A, B, DRB1) within 2 mismatch
- **EPO:** 500IU/kg × 2, 250IU/kg × 6
- **Cyclosporin**
  - Goal concentration: 100~200ng/mL
  - 4 weeks

Time line



Outcome measurements

- Gross Motor Function Measure (GMFM)
- Gross Motor Performance Measure (GMPM)
- Korean Bayley Scale 2nd version (BSID-II)
- Gross Motor Function Classification System (GMFCS)
- Alberta Infant Motor Scale (AIMS)
- Selective Control Assessment of the Lower Extremity (SCALE)
- Pediatric Evaluation of Disability Inventory (PEDI)
- Quality of Upper Extremity Skills Test (QUEST)
- Modified Ashworth Scale (MAS)
- Modified Tardiue Scale
- WeeFIM
- Range of Motion
- Manual Muscle Testing : 10 muscles in each side of upper and lower extremities
- Brain Diffusion Tensor Imaging (DTI) : FA value
- Brain ^{18}F-FDG-PET : analyzed using SPM3 implanted in MatLab R2011a, paired t-test statistics, voxels with an uncorrexted p-value <0.05

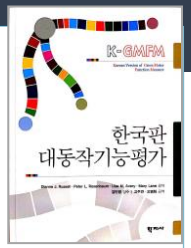
(Min et al. 2013, Stem Cells)

Reliability achievement for efficacy measures

GMFM-88

Reliability and Responsiveness of the Gross Motor Function Measure-88 in Children With Cerebral Palsy

Jooyeon Ko, MinYoung Kim *(Phys Ther, 2013)*



GMFM relative and absolute reliability

- 10 raters, 84 children with CP
- Relative reliability
  ICC (intraclass correlation coefficient): excellent (0.952-1.000)
- Absolute reliability
  SEM (standard error of measurement): 1.60 <10%
  SRD (smallest real difference): 3.14 <10% all acceptable

FA in DTI (Diffusion Tensor Imaging)

Reliability of fractional anisotropy measurement for children with cerebral palsy *(Neuropediatrics, 2013)*

Fractional anisotropy of corticospinal tract and ascending sensory pathway

- 4 raters, 78 children with CP
- Relative reliability
  Interrater ICC: excellent (≥ 0.91)
  Intrarater ICC: excellent (≥ 0.85)
- Absolute reliability
  Interrater SRD: acceptable <12%
  Intrarater SRD: acceptable <10%, All acceptable

arm Annals of Rehabilitation Medicine

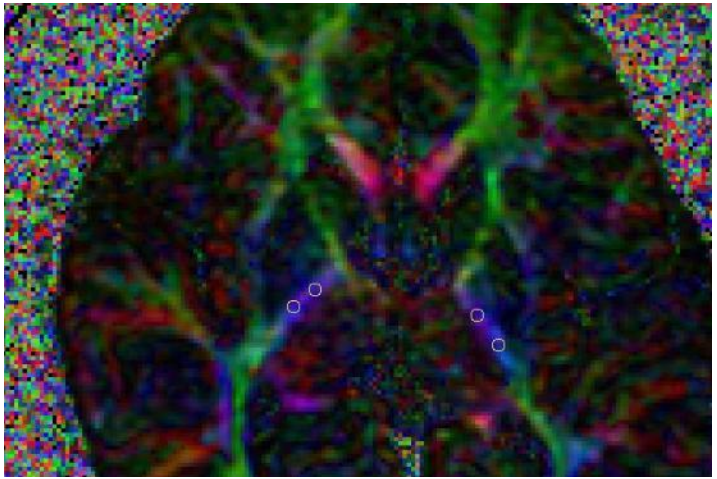
Reliability and Applicability of the Bayley Scale of Infant Development-II for Children With Cerebral Palsy

Ji Hyun Lee, MD, Hye Kyung Lim, EunYoung Park, Junyoung Song, MD, Hee Song Lee, MD, Jooyeon Ko, PhD, MinYoung Kim, MD

BSID-II reliability and validity

- 10 raters, 68 children with CP
- Interrater ICC: excellent (0.99)
- Correlation between Motor raw score and GMFM: r=0.84, p<0.001
- Correlation between Mental raw score and GMFM: r=0.65, p<0.001

DTI & fractional anisotropy (FA) measurements



- MRI : 3T GE Signa System
- DTI data were acquired using 2D axial spin echo echo-planar imaging with refocusing pulses
- Sequence parameters

  : TR/TE of 12000/108 msec
  1NEX, 48 slices
  24 cm FOV
  128 x 128 matrix
  3.0 mm slice thickness
  25 gradient directions
  B=900; with a non-diffusion weighted baseline image (B=0)

- Imaging data then was processed using DTI studio.
- FA value
  - Anterior & posterior portion at posterior limbs of internal capsule, bilaterally
  - Posterior lower pons, area of spinothalamic tract , bilaterally
- Rater : blind to subject information, 1 physiatrist
- ICC scores of test-retest reliability : 0.906 ~ 0.987 (1 rater, n=50)

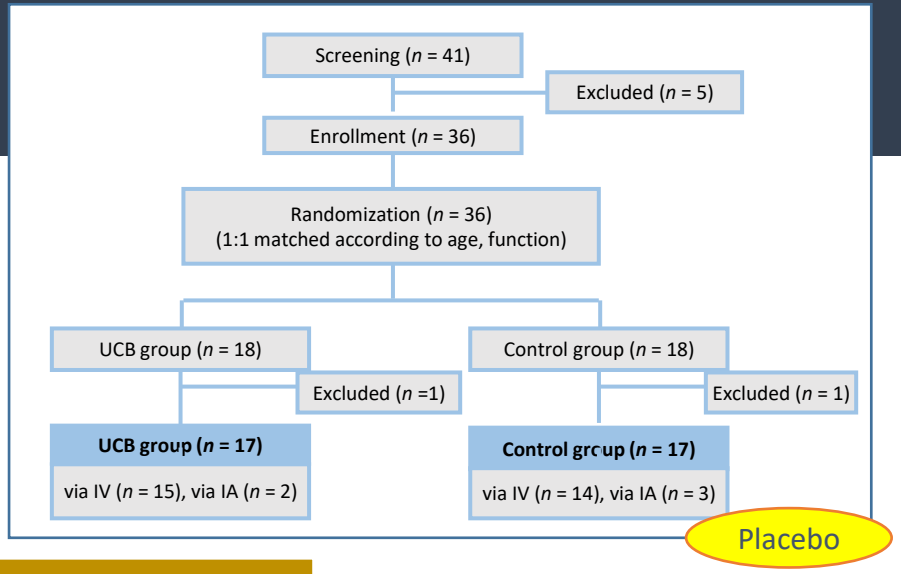
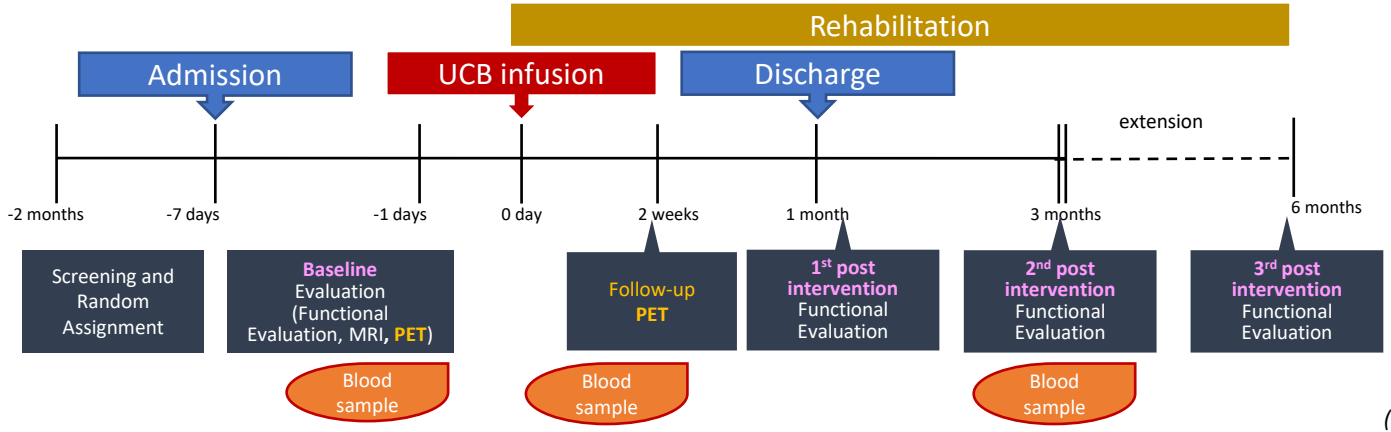
ORIGINAL RESEARCH REPORT

Involvement of Immune Responses in the Efficacy of Cord Blood Cell Therapy for Cerebral Palsy

Mino Kang,[1,*] Kyunghoon Min,[2,*] Joonyoung Jang,[2] Seung Chan Kim,[1] Myung Seo Kang,[3] Su Jin Jang,[4] Ji Young Lee,[4] Sang Heum Kim,[5] Moon Kyu Kim,[6] SeongSoo A. An,[1] and MinYoung Kim[2]





Intervention

- **IV or IA (transfemoral) administration**
- **Allogeneic UCB**
  - TNC>2×10^7/kg
  - HLA (A, B, DRB1) within 2 mismatch
- **Cyclosporin**
  - Goal concentration: 100~200ng/mL
  - 2 weeks (3 d IV → oral)

(Kang et al. 2015, Stem Cells Dev)

Outcome measurements

- **Behaviors**
  - Manual Muscle Testing (MMT): 10 muscles in each side of upper and lower extremities; neck; and trunk muscles
  - Gross Motor Function Measure (GMFM)
  - Gross Motor Performance Measure (GMPM)
  - Bayley Scale 2nd version (BSID-II): Mental and Motor scales
  - Gross Motor Function Classification System (GMFCS)
  - WeeFIM

- **Cytokines** in peripheral blood: Innate immune and Inflammation related cytokines
- **Receptor assay** measured with Bradford assay
  - TLR-2, TLR-4
  - mTOR
- Brain ^{18}F-FDG-PET
  - analyzed using SPM3 implanted in MatLab R2011a
  - paired t-test statistics
  - voxels with an uncorrected p-value <0.05

Demographic and baseline characteristics of patients (N = 34)

Group	UCB (n = 17)	Control (n = 17)
Demographics		
Sex, no. (% male)	10 (58.8)	8 (47.1)
Age, months; mean (SD; range); median	46.8 (60.1; 6–216);26.0	45.3 (41.7; 8–180); 35.5
Gestational age, weeks, mean (SD; range)	31.8 (4.7; 25–40)	33.4 (4.8; 27–40)
Preterm, no. (%)	14 (82.4)	12 (70.6)
Birth weight (SD; range), kg	1.9 (0.7; 1.0–3.1)	2.2 (0.8; 1.2–3.6)

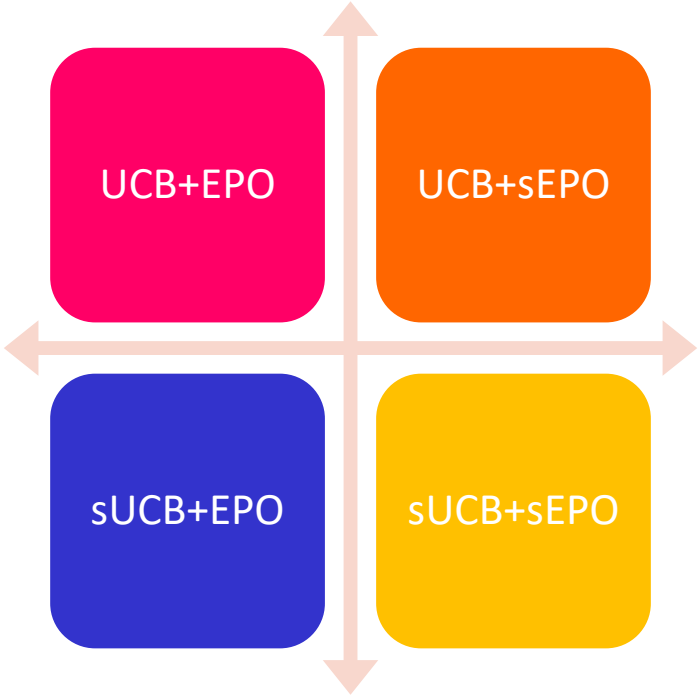
Allogeneic Umbilical Cord Blood Therapy combined with Erythropoietin for Children with Cerebral Palsy

: A 2x2 Factorial, Double-blind, Randomized, Placebo-controlled Trial



sUCB: sham UCB

sEPO: sham EPO

(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Protocol of the 3rd trial (approved by Korean FDA)

Study participants

Patients with cerebral palsy who visited rehabilitation clinic, in a University hospital from October 2013 to October 2015 and fulfill the following criteria are eligible.

Inclusion criteria

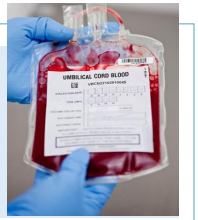
- Diagnosed with cerebral palsy
- Age of ≥ 10 months and ≤ 6 years
- Mismatch in HLA-A, -B, and -DR ≤ 2, and total nucleated cell count ≥ 3×10^7 /kg
- If the cell count is less than given values, more than 1 unit could be used
- Hemoglobin level < 13.6 mg/dL
- Written informed to participation in the study obtained from the subject's representative
- Willingness and ability to be hospitalized according to the schedule specified in the protocol and continue to participate for 12 months after study entry

(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Therapeutic regimen of the 3rd trial

UCB

- Allogeneic (Cryopreserved in CHA Medical Center)
- Number of total nucleated cell ≥ $3x10^7$/kg
- Matched for at least 4 out of 6 HLA-A, B, and DR



EPO

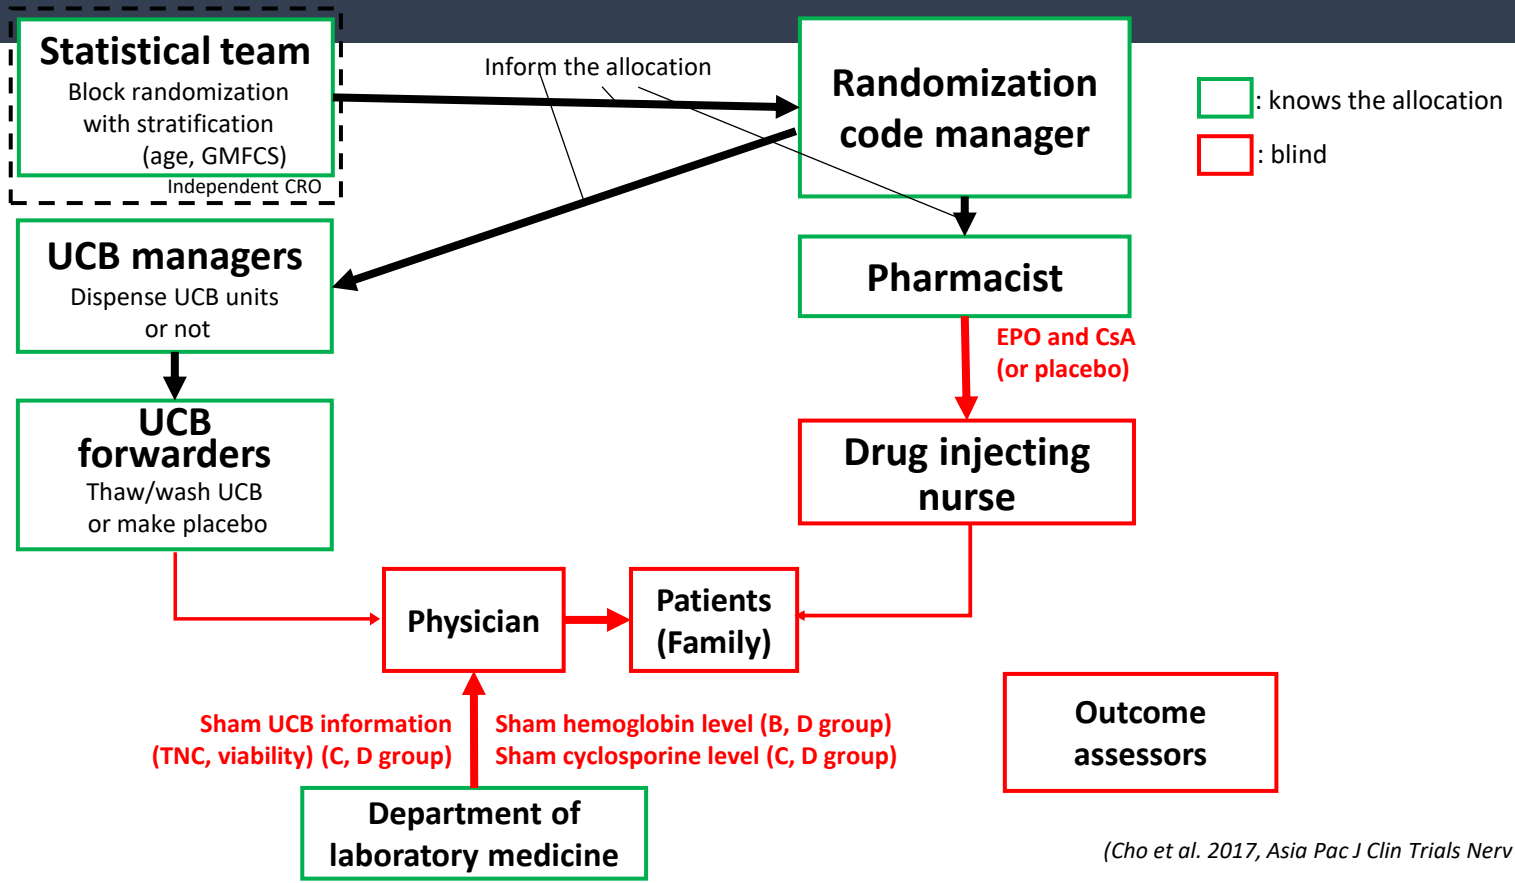
- Adjuvant to potentiate the UCB therapy
- IV 500 IU/kg at 2 hours before UCB (or placebo)
- From Day 3, SC 500 IU/kg EPO 5 times more every three days
- Placebo EPO was provided by the manufacturer (LG Chem.)

Cyclosporine

- Survival of infused UCB cells ↑, GVHD↓
- 7mg/kg bid for 16 days (A, B) or placebo (C, D)
- Placebo cyclosporine was provided by the manufacturer (ChongKunDang Pharm.)

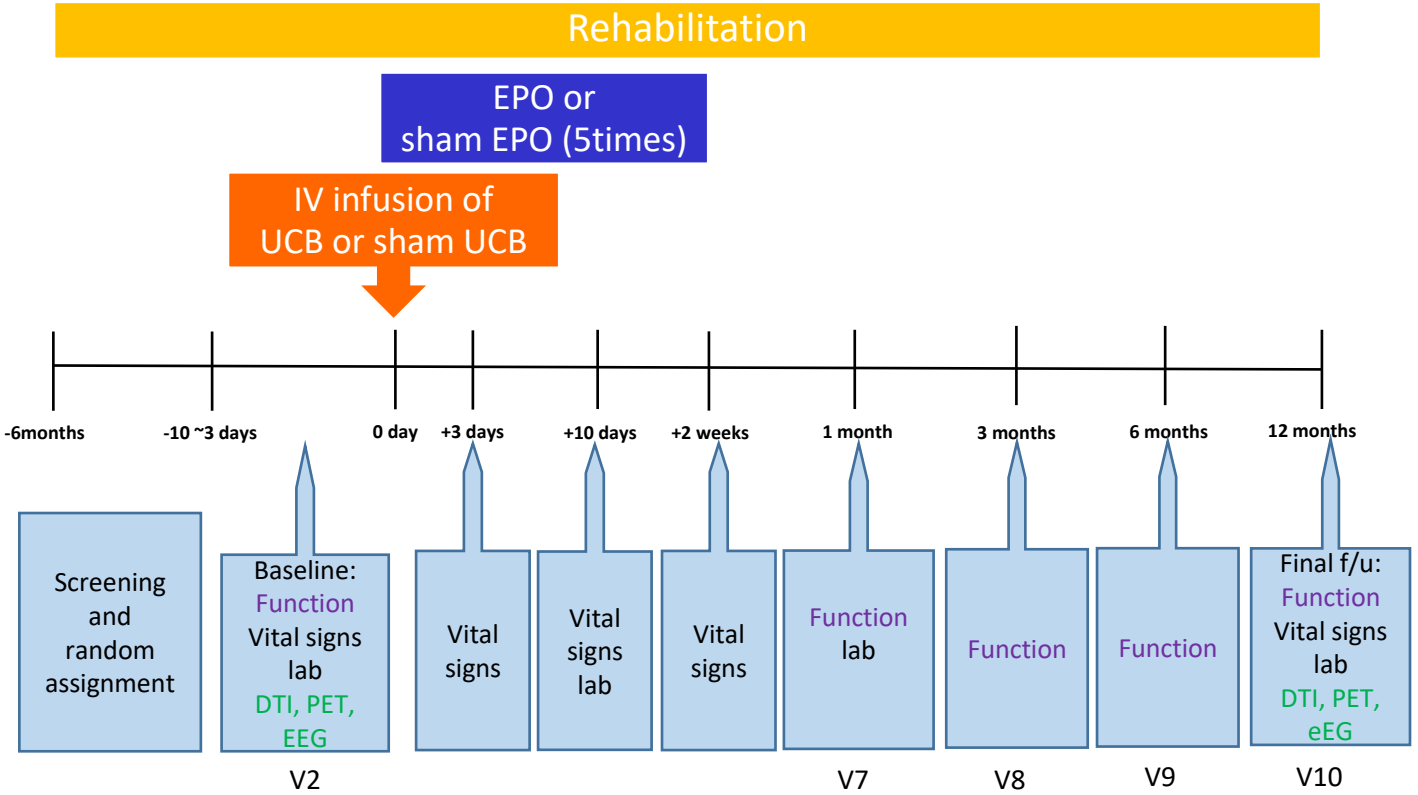
(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Randomization (1:1:1:1 block) & Double-blind Process



(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Timeline of the 3rd trial



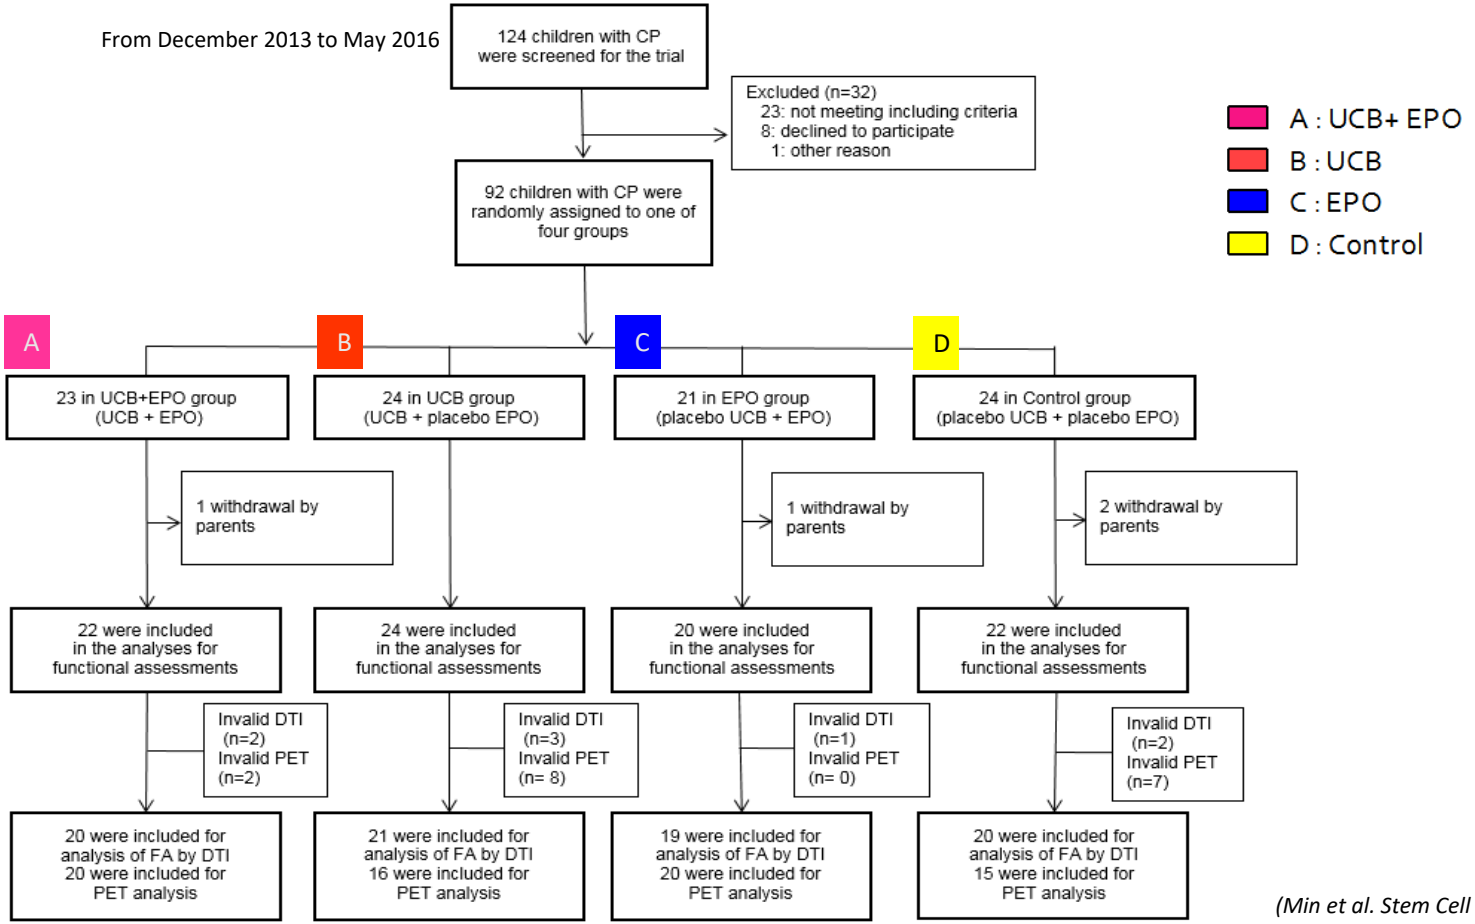
(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Outcome measures in the 3rd trial

- **Primary outcomes**
  - Gross Motor Performance Measure (GMPM)
  - Gross Motor Functional Measure (GMFM)
  - Bayley Scales for Infant Development-II (BSID-II)
- **Secondary outcomes**
  - Gross Motor Function Classification System (GMFCS)
  - Pediatric Evaluation of Disability Inventory (PEDI)
  - Functional Independence Measure for Children (WeeFIM)
  - Summed scores on manual muscle testing (MMT)
  - Visual motor integration (VMI)
  - Selective control assessment of lower extremity (SCALE)
  - modified Ashworth scale (MAS)
  - modified Tardieu scale for hamstring
  - Quality of Upper Extremity Skills Test (QUEST)
  - Fractional isotropy in DTI tractography
  - Findings in 18F-FDG-PET/CT

(Cho et al. 2017, Asia Pac J Clin Trials Nerv Syst Dis)

Study flow in the 3rd trial



(Min et al. Stem Cell Ther Res Accepted)

Demographic and baseline participant characteristics (N = 88)

Group	UCB+EPO[a] (n = 22)	UCB[b] (n = 24)	EPO[c] (n = 20)	Control[d] (n = 22)
Demographics

[a]UCB+EPO group (n=22) received UCB and EPO. [b]UCB group (n=24) received UCB and placebo EPO. [c]EPO group (n=20) received placebo UCB and EPO [c]Control group (n =22) received placebo UCB and placebo EPO. [e]*p* values were calculated for difference among four groups of the number of patients with reported adverse events using Fisher's exact analysis.

[f]Serious adverse events were defined as any event, resulting in death, life-threatening, requiring hospitalization or prolongation of hospital stay. The source of terminology was Medical Dictionary for Regulatory Activities (MedDRA) 21.1.

(Min et al. Stem Cell Ther Res Accepted)

Safety of UCB + EPO combination treatment

- At least 10 years (since 2009), from previous trials of UCB only or UCB + EPO therapy, no long-term safety related issues were raised, including
  - Tumorigenesis: whole body
  - Aggravation or occurrence of newly-developed seizure

Erythropoiesis caused by EPO administration

Allogeneic Umbilical Cord Blood Therapy Combined with Erythropoietin in Children with Cerebral Palsy: a Two Year Follow Up

Protocol

IRB No.2015-06-093

ClinicalTrials.gov NCT03130816

Study participants

Among the patients with cerebral palsy who were enrolled in the first trial, those who agreed to take the second trial were included

Inclusion criteria of the first trial

- Diagnosed with cerebral palsy
- Age of ≥ 10 months and ≤ 6 years
- Mismatch in HLA-A, -B, and -DR ≤ 2, and total nucleated cell count ≥ 3×10^7 /kg
- If the cell count is less than given values, more than 1 unit could be used
- Written informed to participation in the study obtained from the subject's representative
- Willingness and ability to be hospitalized according to the schedule specified in the protocol and continue to participate for 12 months after study entry

(Unpublished Data)

Therapeutic Regimen

UCB

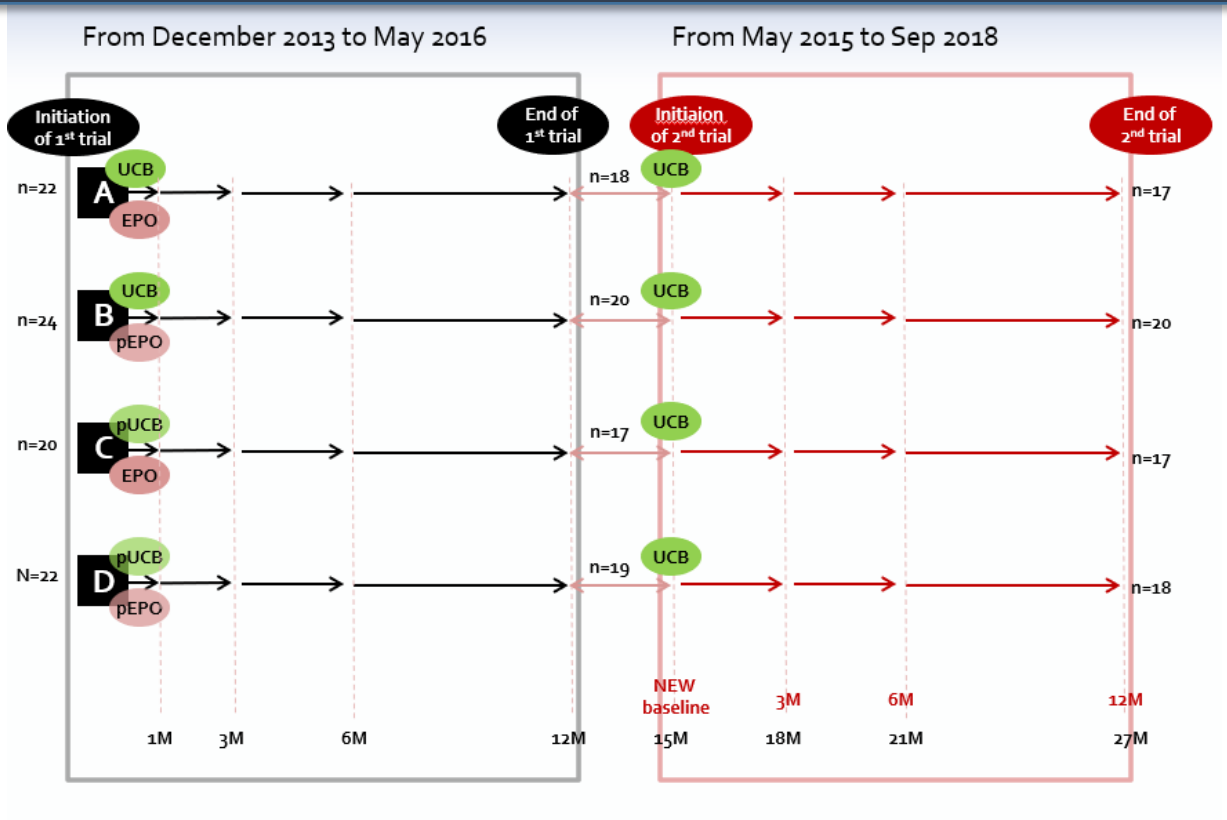
- Allogeneic, total nucleated cell ≥ $2x10^7$/kg
- Matched for at least 3 out of 6 HLA-A, B, and DR
- Intravenous infusion

Cyclosporine

- Survival of infused UCB cells ↑, GVHD↓
- 7mg/kg bid oral administration for 9 days (from 2 d before UCB infusion)

And, essentially intensive rehabilitation.

Study Flow



(Unpublished Data)

Functional Assessment

- **Primary outcomes**
  - Gross Motor Performance Measure (GMPM)
  - Gross Motor Functional Measure (GMFM)
  - Bayley Scales for Infant Development-II (BSID-II)

  At baseline, and 3, 6, and 12 months after the second intervention

- **Subgroup Analysis**
  - Performed among those with severe impairments, whose gross motor functional classification system (GMFCS) levels were either IV or V

Baseline Characteristics

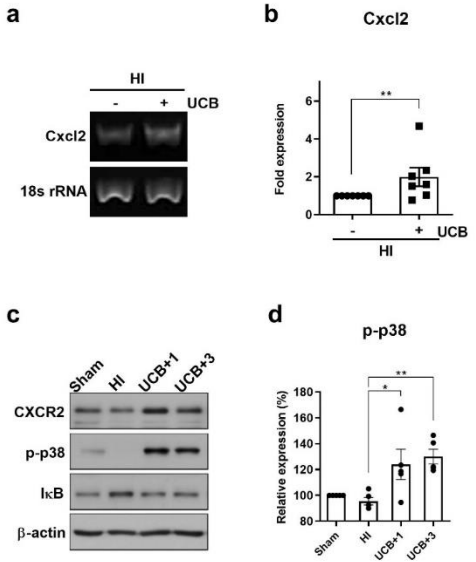
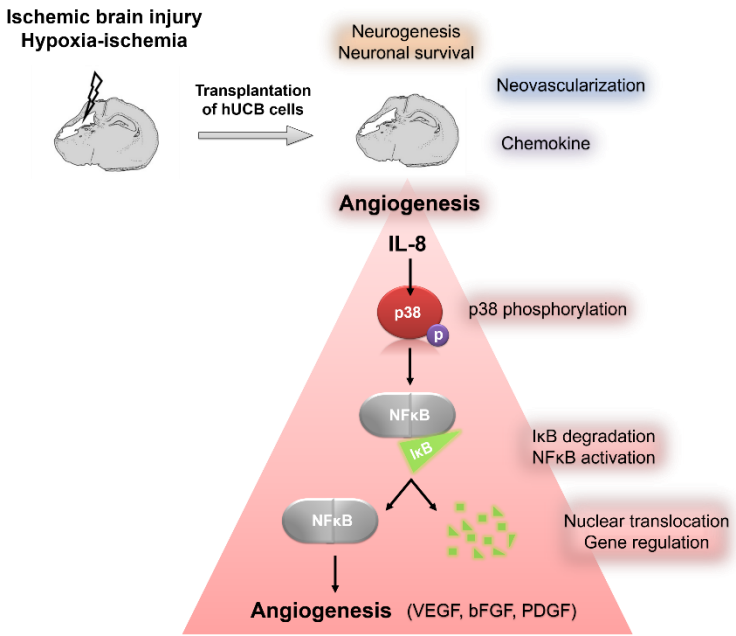
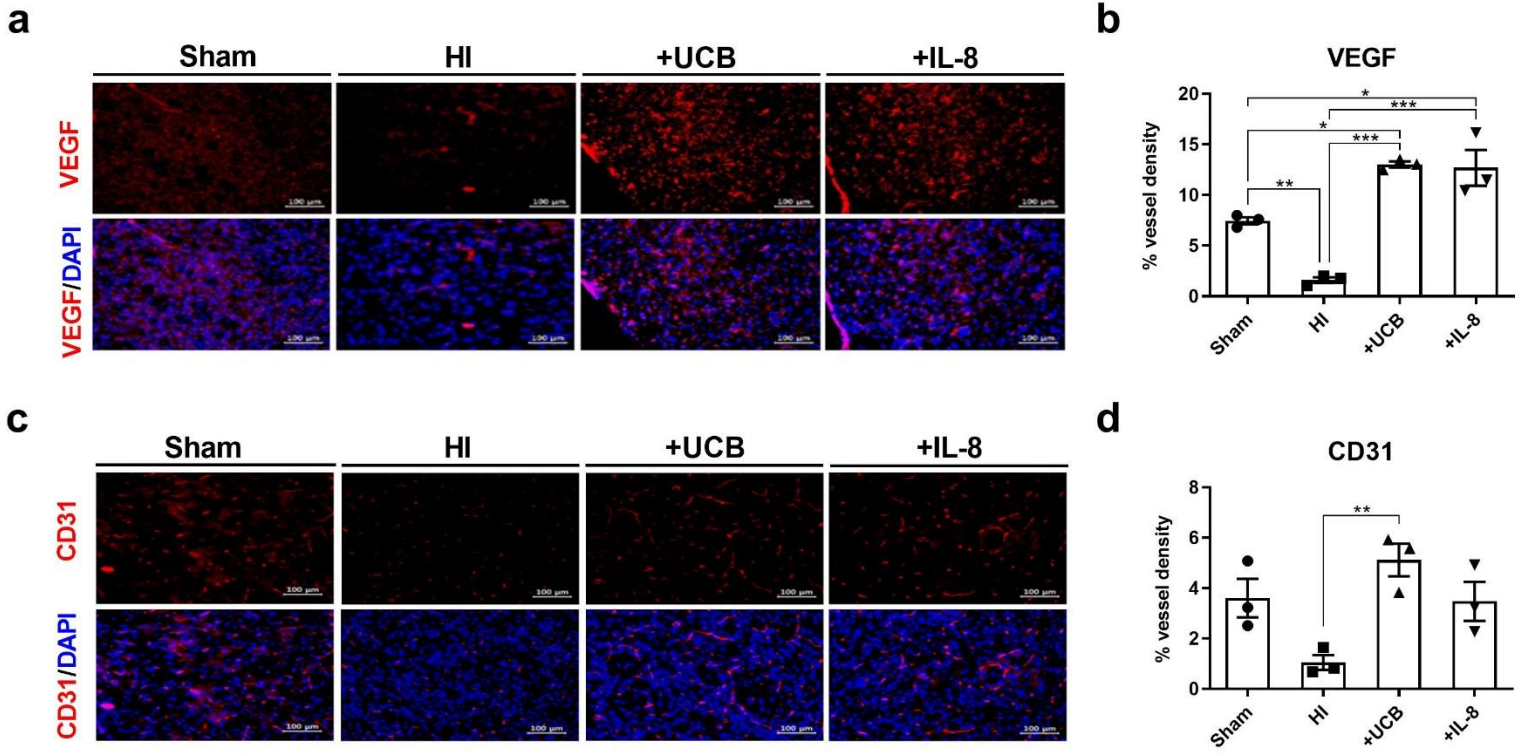
- In mice, deletion of IL-8 gene coding → Cxcl2 is a functional homologue
- CXCR2 mediates signal transduction (human IL-8)

Brain tissue RT- PCR





Angiogenic effect by UCB or IL-8 in vivo



Summary

- Three double-blind RCT showed therapeutic efficacy of allogeneic UCB +/- EPO without harmful side effects
  - 1st RCT (allogeneic UCB+EPO *vs* EPO *vs* control)
    - UCB+EPO therapy showed superior outcomes in motor function at 3rd and 6th months post-intervention compared to EPO-received and control groups.
    - White matter integrity was increased at 6 month post-intervention by UCB+EPO therapy.
    - Amelioration of inflammation in the brain at 2 weeks after the intervention were observed.
  - 2nd RCT (IV and IA allogeneic UCB *vs* control)
    - Infusion without EPO showed superior outcomes in motor function at 3rd and 6th months post-intervention
    - Involvement of innate immunity was observed by elevation of related molecules and correlation with outcomes
    - Amelioration of inflammation in the brain at 2 weeks after the intervention were observed.
  - 3rd RCT (allogeneic UCB+EPO *vs* UCB *vs* EPO *vs* control) → 4th clinical study
    - UCB+EPO therapy showed superior outcome in motor function at 1 year & 2 years post-intervention.
    - White matter integrity was increased at 1 year post-intervention by UCB+EPO therapy in a thalamic radiation.
    - Electroencephalographic findings showed maturation of brain wave by any of the interventions.

Summary

- Efficacy factors were consistently found to be significant in allogeneic UCB therapy
  - Immune histocompatibility
    - More matched units of HLA-A, B, DRB1 showed better outcomes than less matched units (all 3 RCTs)
  - Numbers of total nuclear cells
    - More number of TNCs showed better outcomes than less number of TNCs (all 3 RCTs)
- Mechanism of UCB +/- EPO therapy in brain damage
  - Decrement of neuroinflammation
    - appeared in FDG-PET in 2 RCTs with 2-weeks follow-up
  - Involvement of innate immunity
  - Increment of neuronal survival, neurogenesis, and angiogenesis
  - Decrement of astrogliogenesis
- Therapeutic efficacy of allogeneic UCB can be potentiated with concomitant EPO use
  - Functional outcomes in clinical results, and *in vivo* and *in vitro* findings also supported the findings

Conclusion

- UCB has efficacy without harm for neural recovery in brain damage
  - Cerebral palsy, Stroke,..
- Efficacy of UCB is enhanced by combined treatment of erythropoietin
  - No harmful effect, under monitoring of hemoglobin level
- Suggested therapeutic mechanism
  - Neurogenesis, improvement in white matter integrity
  - Anti-inflammation in the brain tissue
  - Stimulation of innate immunity that may be related with healing
  - Angiogenesis
